

This work explores the interdependence between humans and animals through a symbiotic relationship. It specifically depicts how seizure dogs assist individuals with epilepsy by sensing early signs of an oncoming episode and helping them prepare and respond. Copper wire crocheting with beads and air-dry clay are used to create this three-dimensional structures, representing a interconnected system. Together, these elements illustrate a shared environment in which both human and animal support one another's needs. The artwork is displayed upside down. The lower board visualizes smelling molecules dispersed from the human body, spreading throughout the surrounding space. The upper section traces the dog's movement path as it detects these signals and responds, guiding itself toward key locations containing essential items such as medication, water, and blankets. Overall, the work aims to highlight a less commonly represented form of human&animal interdependence and raise awareness of service animals.
