Bee My Eyes

Amblyopia Training Game for Children

Presented By: Team 42
Emily Li, Tanya Shi,
Qiyang Su, Yuchen Xiao

Background

Amblyopia (“lazy eye”) is when one (or sometimes both) eyes have **reduced vision** because the brain and eye are not working together properly. The brain favors the stronger eye, which prevents the weaker eye from developing normal visual processing.

Affected population

Up to 3 / 100 children
Most common cause of vision loss in kids

Large untapped target audience due to biases and limited options

Treatment

Differentiating vision between stronger and weaker eye

- Patch therapy
- Wearing anaglyph glasses
- Vision training games

Existing Solutions

- Red-blue glasses paired with an online game app
- block or reveal certain colors to train the weaker eye

Problem Statement

Amblyopia affects children's eye-hand coordination. However, most games on the market concentrate on improving the weaker eye through monocular training and fail to address the cooperation and coordination skills with hands. **This creates a critical gap in current treatment options.**

Our Solution

Bee my eyes, a children-friendly maze game that improves amblyopia while training hand-eye coordination.

Game design based on **red and blue accent colors**, **differentiating** what each eye sees when children wear anaglyph glasses

Inspired by the natural phenomenon of **bee colonies** as a **fun framework** for a children's game

Leaning into the importance of **consistent training** and building a **daily habit** by establishing the incentive of a **streak system**

Level Records

Game Page

***Use with
anaglyph glasses
to separate each
eye's view, forcing
the weaker eye to
work together with
the stronger one.**

Final Page

- Amblyopia happens when the brain starts favoring one eye over the other.
- The suppression score is a simple number (0–1) that **shows how big that imbalance is**.
- 0 = Both eyes contribute equally
- 1 = The stronger eye is doing almost all the work
 - Example: Score of 0.65
 - The brain is somewhat ignoring the weaker eye
- Our game uses this score to **automatically adjust contrast of the color** so the weaker eye is gently pushed to work harder.

Marketing Analysis

Primary Market:
US domestic market
total children aged 3 – 12: 46.2 million

4% children having amblyopia: 1.848 million

Hand-eye coordination focus
Children-friendly interfaces

Affordability: Free basic functions

Scalability: multi-lingual version & broaden customer age range

Revenue streams:

Advertising, premium subscriptions, institutional partnerships

Cost Structure:

research and development. marketing, customer support services
